

Discussion Unit:

DSE Core, Troubleshooting

Introduce DSE Core Troubleshooting

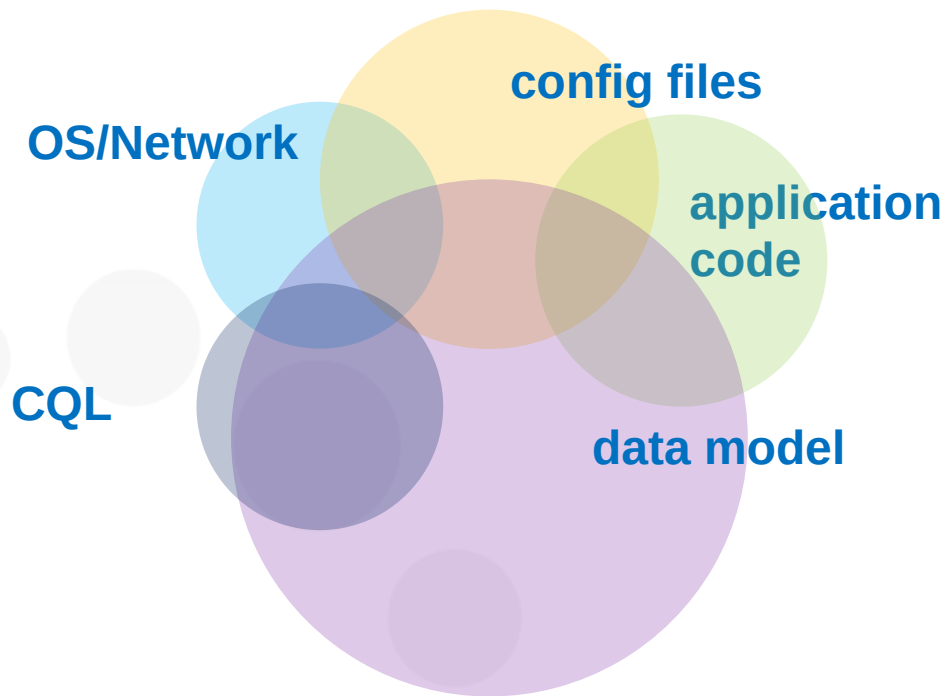

Discussion Lab:

Name 2

DSE Core Troubleshooting, Sources of Error, Name 2

Discussion Lab: Sources of (Trouble)

You already know a lot-

List 2 sources of error/trouble per area on the left ..

End of Discussion Lab:

DSE Core Troubleshooting, Sources
of Error, Name 2

Troubleshooting: Examples

Complaint: Cluster is not consistent

Configuration files differ

- Manual change instead of repository
- Forget to change on one node
- Typos on some nodes not others
- Not version controlled so can't tell who did what

Bad networking

- Check network stats
- May require a change to phi conviction

Troubleshooting: Examples

Complaint: reads/writes are slow

Using spinning disks and have all paths on the same disk

- Break each operation (commit logs, data, etc) to different disks
 - This can even be helpful for SSD's but not near the drastic change
 - NO SAN, NAS, SAMBA or attached storage

Lots of tombstones (reads)

Writing large blocks of data

- May be dependent on network/disk speed
 - General physics

Over Allocation of JVM memory (reads)

- Not allowing any memory for page cache

Troubleshooting: Examples

Compaction or repairs are eating all resources

- Are compaction strategies correct?
- May need more memory or CPU or both
 - Could be hardware limitations, do they follow the sizing guide according to workload

Wrong sort order for clustering columns

- Have to read all the partition on the system then pull data from bottom of CC rather than reading the top and stopping

Troubleshooting: Expert Level

- Every setting in every configuration file; identifiers, tunables, capacities
 - Is each setting too high/low, What (nodetool), other to confirm
- Read DSE Jiras; a lot of data is already known
- Meet with significant customers; what standards do they adopt and why
- Solid engineering; decomposition, change one variable at a time
